Which of the following is a characteristic of a healthy diet?

- A) High in sugar and fats
- B) Contains a variety of nutrients
- C) Lacks vitamins and minerals
- D) Contains only carbohydrates

Answer: B) Contains a variety of nutrients

Explanation:

A healthy diet includes a variety of nutrients such as proteins, carbohydrates, fats, vitamins, and minerals necessary for proper body functioning. Options A, C, and D are incorrect because they do not provide a balanced intake of essential nutrients.

Question 2:

The process by which plants make their own food is called:

- A) Respiration
- B) Photosynthesis
- C) Digestion
- D) Fermentation

Answer: B) Photosynthesis

Explanation:

Photosynthesis is the process by which green plants convert light energy into chemical energy, using carbon dioxide and water to produce glucose and oxygen. Respiration is the breakdown of food for energy, digestion occurs in animals, and fermentation is a different metabolic process.

Question 3:

Which part of the human body is responsible for pumping blood?

A) Brain

B) Liver

C) Heart

D) Kidney

Answer: C) Heart

Explanation:

The heart pumps blood throughout the body, delivering oxygen and nutrients to tissues and removing waste products. The brain controls body functions, the liver processes nutrients, and the kidneys filter blood.

Section B: Structured Questions

Question 4:

Describe the process of photosynthesis, including the raw materials and the products formed.

Answer:

Photosynthesis is a process carried out by green plants, algae, and some bacteria to produce their own food. It occurs mainly in the leaves, within specialized structures called chloroplasts, which contain chlorophyll.

Raw Materials:

- Carbon dioxide (CO₂) from the atmosphere
- Water (H₂O) absorbed by the roots
- Light energy from the sun

Process:

- Chlorophyll absorbs light energy.
- This energy converts carbon dioxide and water into glucose (a form of sugar) and oxygen.
- The general equation for photosynthesis is:

Products:

- Glucose (used by the plant for energy and growth)
- Oxygen (released into the atmosphere)

Importance:

Photosynthesis is vital because it is the primary source of oxygen and the foundation of the food chain.

Question 5:

Explain the importance of the human respiratory system.

Answer:

The human respiratory system is crucial for breathing and gas exchange. Its main functions include:

- Supplying oxygen: It takes in oxygen from the environment, which is essential for cellular respiration.
- Removing carbon dioxide: It expels carbon dioxide, a waste product of cellular respiration, from the body.
- Maintaining blood pH: Proper removal of CO₂ helps regulate the acidity of the blood.
- Supporting speech: The lungs work with the vocal cords to enable speech.

Main organs involved:

- Nose and nasal cavity (air intake)
- Trachea and bronchi (air passage)
- Lungs (gas exchange)
- Diaphragm (muscle aiding breathing)

Proper functioning of this system is essential for sustaining life and overall health.

Section C: Practical and Diagram Questions

Question 6:

Draw a labeled diagram of the human heart and explain its role in the circulatory system.

Answer:

(A detailed labeled diagram should include the following parts)

- Right atrium
- Right ventricle
- Left atrium
- Left ventricle
- Aorta
- Pulmonary artery
- Pulmonary vein
- Vena cava

Explanation:

The heart is a muscular organ that pumps blood throughout the body. It has four chambers: two atria and two ventricles. The right side receives deoxygenated blood from the body and pumps it to the lungs via the pulmonary artery for oxygenation. The left side receives oxygen-rich blood from the lungs via the pulmonary veins and pumps it to the rest of the body through the aorta. This continuous process maintains circulation, delivering nutrients and oxygen to tissues and removing waste products.

Question 7:

Identify the parts of the human eye and describe their functions.

Answer:

- Cornea: Transparent outer layer that protects the eye and helps focus light.
- Iris: Colored part controlling the size of the pupil to regulate the amount of light entering.
- Pupil: Opening that allows light into the eye.
- Lens: Focuses light onto the retina.
- Retina: Contains sensory cells that convert light into electrical signals sent to the brain.
- Optic nerve: Transmits electrical signals from the retina to the brain for interpretation.

The eye enables us to see and interpret our surroundings by detecting light and color.
