- c) Absorption of oxygen in animals
- d) Transport of water in plants

Answer:

- a) Conversion of light energy into chemical energy in plants

Section B: Structured Questions

Question 4:

Describe the process of osmosis in cells. Include its importance in biological systems.

Answer:

Osmosis is the movement of water molecules from a region of higher water potential to a region of lower water potential across a semi-permeable membrane. This process is passive and does not require energy. In biological systems, osmosis is vital for maintaining cell turgidity, facilitating nutrient absorption in roots, and regulating water balance in animals. For example, plant cells rely on osmosis to keep their cell walls firm, while animal cells depend on osmosis to prevent dehydration or swelling.

Question 5:

Explain the role of enzymes in biological reactions. Illustrate with an example.

Answer:

Enzymes are biological catalysts that speed up chemical reactions without being consumed in the process. They work by lowering the activation energy required for reactions, thereby increasing reaction rates. For example, the enzyme amylase catalyzes the breakdown of starch into simpler sugars like maltose in the human digestive system, facilitating nutrient absorption.

Section C: Extended Essay/Discussion

Question 6:

Discuss the importance of pollination in plant reproduction and describe the different methods by which pollination occurs.

Answer:

Pollination is crucial for plant reproduction as it enables the transfer of pollen from the male anthers to the female stigma, leading to fertilization and seed formation. Successful pollination ensures genetic diversity and the production of fruits and seeds, which are vital for the survival of plant species.

Pollination methods include:

- Self-pollination: Pollen from the same flower or plant fertilizes the ovule. It ensures reproduction when pollinators are scarce but reduces genetic diversity.
- Cross-pollination: Pollen is transferred from one flower to another of the same species, promoting genetic variation. It occurs via:
 - Biotic agents: Insects (bees, butterflies), birds (hummingbirds), bats
 - Abiotic agents: Wind and water

The adaptation of flowers, such as their color, scent, and structure, often facilitates specific pollination methods, enhancing reproductive success.
