- Understand the reasoning behind each step
- Build confidence in tackling similar problems independently

Common Types of Problems in Section 4 and Their Solutions

1. Finding Angle Measures

One of the fundamental skills in geometry involves calculating unknown angles using known angle measures and properties.

Sample Problem:

Given two angles are supplementary, and one angle measures 65° , find the other.

Solution Steps:

- Recall that supplementary angles sum to 180° .
- Set up the equation: $65^\circ + x^\circ = 180^\circ$.
- Solve for x : $x = 180^\circ - 65^\circ = 115^\circ$.
- Answer: The other angle measures 115° .

2. Properties of Isosceles and Equilateral Triangles

Understanding the properties of special triangles is crucial for solving many problems.

Sample Problem:

In an isosceles triangle, the angles at the base measure 50° each. Find the vertex angle.

Solution Steps:

- Recall that the sum of interior angles in a triangle is 180° .
- Set up the equation: $50^\circ + 50^\circ + x^\circ = 180^\circ$.
- Solve for x : $x = 180^\circ - 100^\circ = 80^\circ$.
- Answer: The vertex angle measures 80° .

3. Congruent Triangles and Criteria

Proving triangle congruence is a major focus, involving criteria like SSS, SAS, ASA, and HL.

Sample Problem:

Given two triangles with sides and angles labeled, determine if they are congruent based on the given information.

Solution Approach:

- Identify the given pairs of sides and angles.
- Check if any of the congruence criteria (SSS, SAS, ASA, or HL) are satisfied.
- Conclude congruence if criteria are met; otherwise, they are not congruent.

Example:

Triangle ABC with $AB = AC$, and angle A is 60° , with corresponding sides in triangle DEF given as $DE = DF$, and angle D is 60° . Since two sides and the included angle are congruent (SAS), the triangles are congruent.
